SWIFT – WIPRO IOS TASK

Task 1: Guided Activity, Student profile card Environment: Playground. Goal: model a student with constants for values that never change and variables for values that do.

1. Create a constant studentName set to your name and a constant rollNumber with an explicit Int annotation.
2. Create variables semester (an Int) and cgpa (a Double with an explicit annotation) and a constant isHosteller (a Bool).
3. Print a single line using string interpolation: Name: Asha, Roll: 2301, Semester: 5.
4. Move to the next semester with semester += 1 and update cgpa, then print a second line.
5. Try to change studentName. Read the error, then comment the line out.
6. Print type(of:) for each value and confirm that Swift inferred the types you expected.

SWIFT – WIPRO IOS TASK

Task 2: store a temperature in Celsius in a variable.

Compute and print Fahrenheit (C * 9 / 5 + 32) and Kelvin (C + 273.15), rounded to one decimal place.

Then change the Celsius value and print again without rewriting the formulas.

Hint: use let for the conversion factors, and String(format: "%.1f", value) after import Foundation.

Task 3: Debug Task, Fix the compile errors

List every compiler error, explain it, and produce a version that compiles and prints the total including tax.

```
let price = 250
var quantity: Int = 3
 let taxRate = 0.18
 price = 300
let total = price * quantity * taxRate
 var title = "Order"
 title = 42
print(total)
```
